On the Industrial World Market, there are many different kinds of couplings for rotating equipment available.

These couplings can be divided into two major categories: the lubricated and the non lubricated types. Gear type couplings, which are of course of the lubricated type, are still dominating the Industrial market.

The reasons why gear type couplings still have a leading market position are directly related to the specific requirement of the various rotating machines in the medium to heavy industries such as the steel, pulp & paper and the cement industry.

Following these requirements, a coupling must:

PRESENT: the lowest torque/weight ratio.  
the highest torque/max. bore ratio.

ALLOW: the combination of important angular, radial and axial misalignment, at the same time.

BE ABLE: to rotate at high rotating speeds, without vibrations.  
to accept the largest possible assembly options to suit the design of the driver and the driven machine.

In this case, a gear type coupling is the ideal solution.

Series NST  
Torque: up to 2000 Nm  
Bore: up to 65 mm

Series CST / ...M  
Torque: up to 174000 Nm  
Bore: up to 290 mm

Series FST  
Torque: up to 504000 Nm  
Bore: up to 1130 mm

### Why Escogear ?

#### High Torque and Misalignment capacity

Thanks to the patented escogear Multicrown profile (used on the C and F series), the optimised coupling design and the standard use of 12.9 quality bolts, the Escogear couplings offer the user a **very high torque capacity**.

This means that for a given torque a smaller coupling can be used which results in more efficient machine design and performance. Furthermore, this high torque is available at important angular misalignment.

#### Transparent coupling selection

The torque capacity of a gear type coupling strongly depends on the angular misalignment to which it is subjected: the higher the misalignment, the lower the torque capacity. It is clear that this relationship can and will cause problems in coupling selection because misalignment during operation is almost impossible to predict. Escogear couplings of the F and C...M type are equipped with Esco Multicrown tooth form. Thanks to this quite unique design, the escogear has a torque capacity that is practically independent of the angular misalignment. Therefore, coupling selection is **easy** and mistakes are avoided : long coupling life is guaranteed.

#### High precision Gearing

Pitch error in the gearing of coupling can strongly affect, the load distribution between the teeth can be strongly influenced. In some cases, the maximum load applied on the teeth can be twice the value of the load calculated. The consequence will be higher surface and root stresses and coupling failure might be the result. Thanks to the high precision manufacturing process and equipment on which all escogear couplings are manufactured, and the sophisticated quality control, pitch error is minimized and the best possible gear quality level and life time can be guaranteed.

#### Reduced backlash

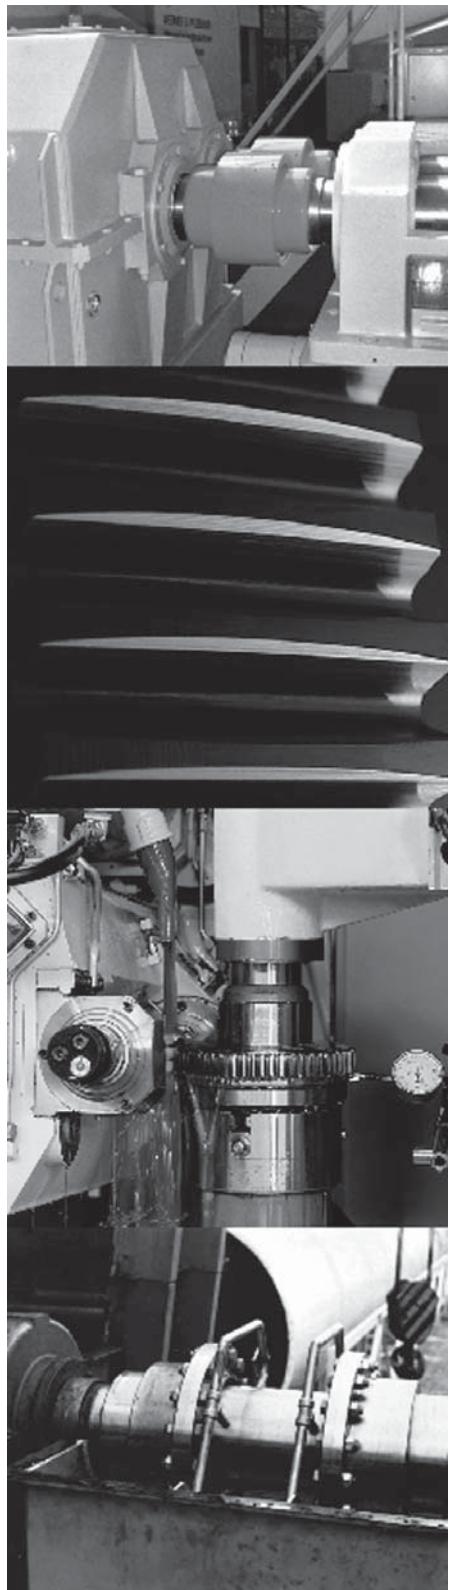

One of the consequences of the Multicrown design is that the necessary backlash between the teeth can be reduced to an absolute minimum. This will reduce the impact loads in start/stop and reversing torque applications. As a result, the teeth can be designed with a larger section and the root stresses will be reduced. Thanks to this feature the escogear couplings are ideal for use in presses, mills, punching machines, portal cranes etc...

#### Perfect gear top centring

Gear type couplings require, in order to operate, a "clearance" between the top of each hub tooth and the root of the sleeve teeth. Due to this clearance, the sleeve cannot be perfectly centred on the hubs. This will create vibrations in applications where the load constantly changes from no load to full load (e.g. portal cranes). These vibrations will of course influence the operation of the connected equipment. Thanks to special design and machining techniques, Esco is able to pilot the top of each hub tooth into the root of the sleeve teeth. By doing so, the sleeve will remain perfectly centred on the hub and vibrations will be avoided. This specific feature is standard on all F and C...M couplings.

#### Excellent protection of components

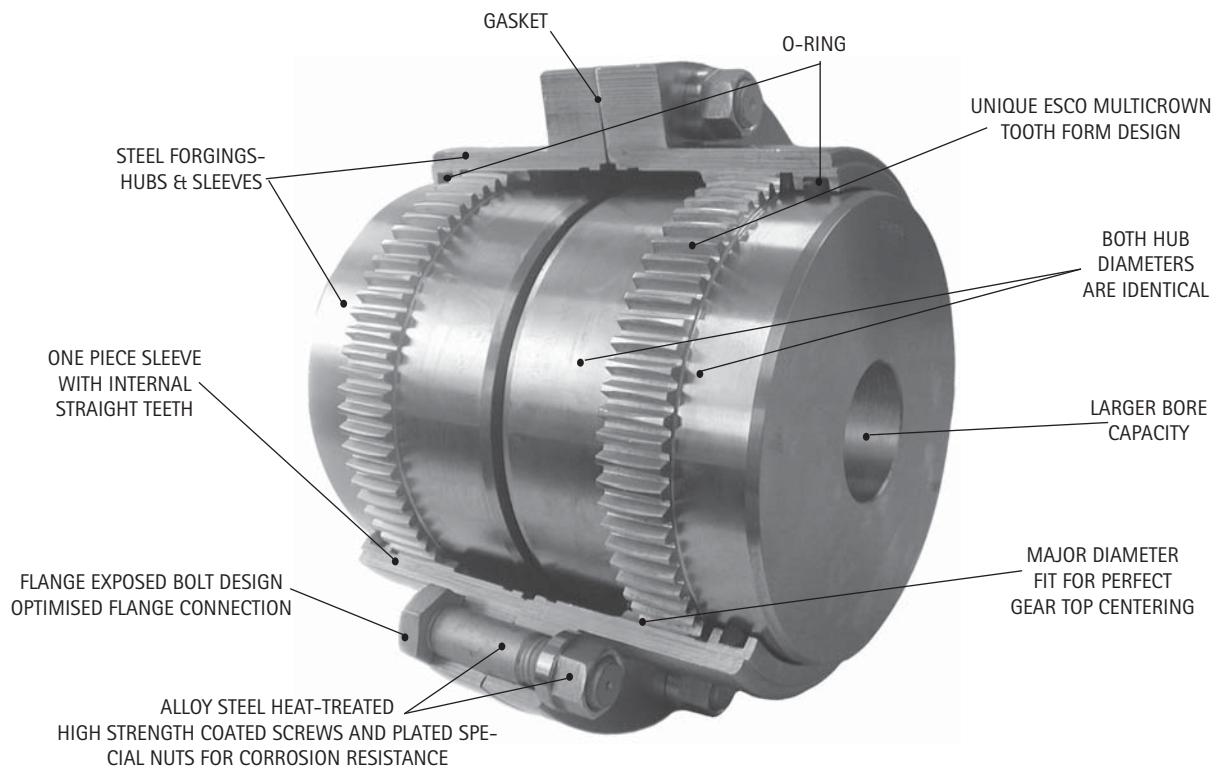

In order to guarantee optimum operation, all escogear couplings are protected with special surface treatment or coating. All bolts are coated with Dacromet and the nuts are zinc plated which gives an excellent corrosion resistance and makes disassembly possible, even after numerous years of service life. Furthermore, all the steel components are protected with a special coating to improve their corrosion resistance.

## SERIES F

WITH ESCO MULTICROWN TOOTH FORM FOR LONG LIFE

Maximum torque: up to 5 040 000 Nm – Bore: up to 1 130 mm

- LOWER STRESSES

The ESCO MULTICROWN tooth form is a curve with constantly changing radii of curvature. The tooth contact area under misaligned conditions has a much larger radius of curvature than conventional crowning. The contact area therefore is larger thus reducing the surface stresses.

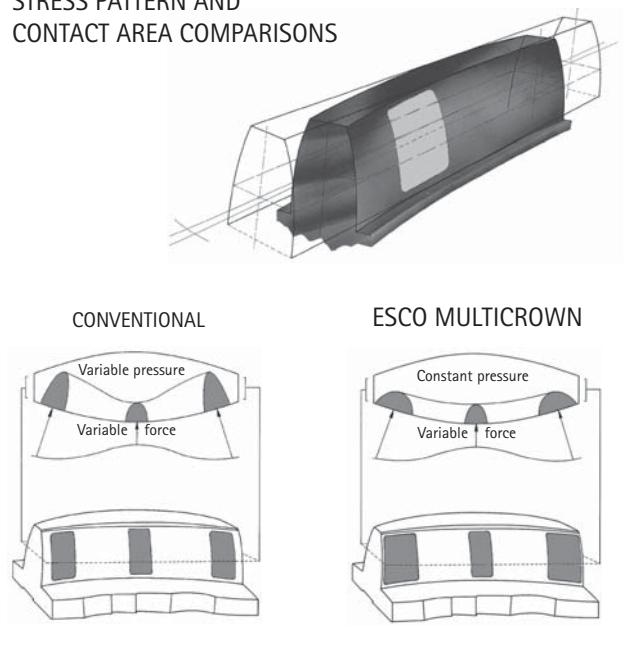

- CONSTANT VELOCITY POWER TRANSMISSION

ESCO generates the ESCO MULTICROWN tooth in such a way that the necessary characteristics for homokinetic conjugate tooth action are perfectly achieved.

- LESS BACKLASH

The ESCO MULTICROWN tooth design requires less backlash for a given angle of misalignment than the conventional crowning, thus reducing shocks in reversing application.

## HOW TO SELECT THE RIGHT COUPLING SIZE

A. Select the size of ESCOGEAR coupling that will accommodate the largest shaft diameter.

B. Make sure this coupling has the required torque capacity according to following formula:  $\text{torque in Nm} = \frac{9550 \times P \times F_u \times F_{\text{Ex}}}{n}$

P = power in kW; n = speed in rpm;  $F_u$  = service factor according to tabulation 1.

$F_{\text{Ex}} = 2$  in case of use in potentially explosive atmospheres  $\text{Ex}$ , European Directive 94/9/EC. In normal atmospheres,  $F_{\text{Ex}} = 1$ .

The coupling selected per (A) must have an equal or greater torque capacity than the result of the formula (B). If not select a larger size coupling. Check if application peak torque does not exceed tabulated peak torque  $T_p$  indicated planographs B410 to B423.

Check also max. allowable misalignment using the graph of tabulation 2.

C. Check if shaft/hub connection will transmit the torque. If necessary, select a longer hub.

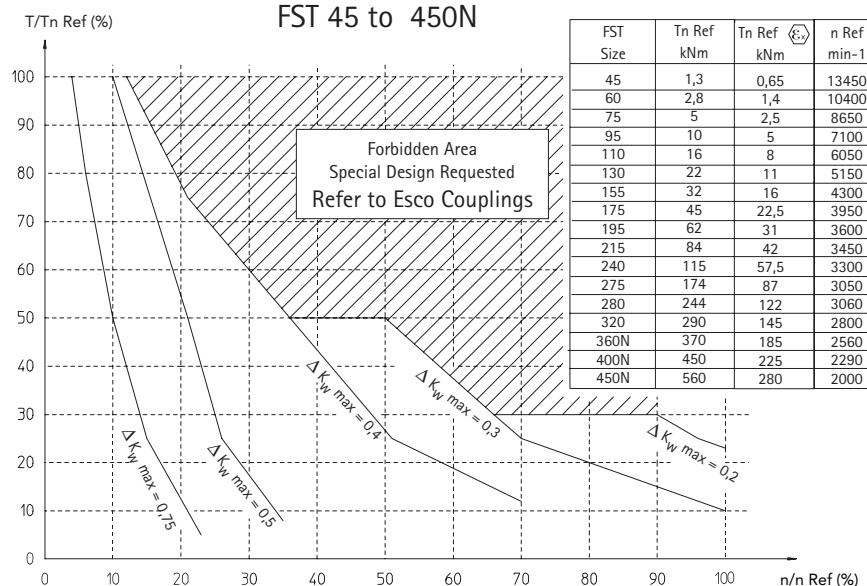

D. Read carefully assembly and maintenance instructions IM/B400.

DRIVEN MACHINE		APPLICATIONS	DRIVER MACHINE		
			Electric motors Turbines	Hydraulic motors Gears drivers	Reciprocating engine Electric motors frequent starts
UNIFORM		Generators - Blowers: centrifugal vane, fans - Centrifugal pumps and compressors - Machine tools: auxiliary drives - Conveyors: belt and chain, uniformly loaded, escalators - Can filling machines and bottling machinery - Agitators: pure liquids.	0,8 to 1,25	1 to 1,5	1,25 to 1,75
		Propeller - Waterjet pumps	1,25	1,5	1,75
MODERATE SHOCKS		Blowers: lobe - Pumps: gear and lobe types - Vane compressors - Machine tools: main drives - Conveyors: belt and chain not uniformly fed bucket and screw - Elevators, cranes, tackles and winches - Wire winding machines, reels, winders (paper industry) - Agitators liquids and solids, liquids variable density.	1,25 to 1,5	1,5 to 1,75	1,75 to 2
HEAVY SHOCKS		Generators (welding) - Reciprocating pumps and compressors - Laundry washers - Bending roll, punch press, tapping machines - Barkers, calanders, paper presses - Briquetter machines, cement furnace - Crushers: ore and stone, hammer mill, rubber mill - Metal mills: forming machines, table conveyors - Draw Bench, wire drawing and flattening machines - Road & railroad equipment.	1,5 to 2	1,75 to 2,25	2 to 2,5

### 1) MAXIMUM MISALIGNMENT

#### TABULATION 2

#### GRAPH (T, n)

#### HOW TO USE THE GRAPH (T,n) ?

Maximum torque, maximum speed and maximum misalignment may not occur simultaneously.

Graph must be used as follows:

- Calculate  $T_n$  and  $T_p$  and select coupling size as usual.  $T_n$  = nominal torque;  $T_p$  = peak torque
- Calculate  $T_n/T_n \text{Ref}$  and  $n/n \text{Ref}$  and plot the resulting point in the graph.
- If the resulting point is located in the white area, a standard coupling may be used as far as maximum misalignment doesn't exceed the maximum misalignment indicated in the graph.
- If the resulting point is located in the shaded area, refer to ESCO COUPLINGS
- In case of use in potentially explosive atmospheres  $\text{Ex}$ , proceed the same way but using  $T_n \text{Ref } \text{Ex}$  for the calculation. Max misalignment may not exceed 0,5° per gear mesh.

2) MINIMUM MISALIGNMENT =  $\Delta K_w \text{min} = 0,1^\circ$

### 3) MISALIGNMENT CONTROL

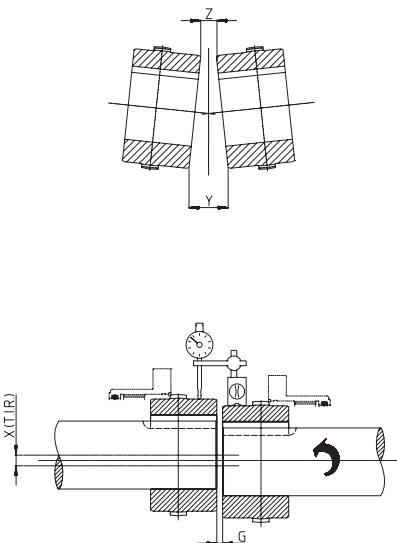

1- Measure X (TIR) - 2- Measure Y-Z - 3- Verify the relationship for the misalignment control:  $\Delta K_w \text{min} \leq \frac{X}{K_x} + \frac{Y-Z}{K_y} \leq 0,75 \times \Delta K_w \text{max}$

$$K_x = K_{x0} + \frac{S}{30} \quad \text{with } S = \text{Spacer length (mm)}$$

(If no spacer:  $S = 0$ )

$$K_y = K_{y0}$$

FST	$K_{x0}$	$K_{y0}$
45	1,92	2,34
60	2,06	3,04
75	2,76	3,71
95	3,25	4,54
110	3,80	5,28
130	4,47	6,22
155	5,03	7,55
175	5,72	8,20
195	6,35	9,18
215	7,47	9,98
240	8,24	11,04
275	9,18	12,98
280	10,82	13,76
320	11,34	15,08
360	12,32	16,76
400	13,37	18,50
450	14,35	20,74

### 4) EXAMPLES:

#### Calculation

$$\left. \begin{array}{l} T/Tn \text{ ref} = 30\% \\ n/n \text{ ref} = 30\% \end{array} \right\} \Delta K_w \text{max} = 0,4^\circ$$

FST 175:  $K_x = 5,72$      $K_y = 8,2$

#### Measurement

$$X (\text{TIR}) = 0,9 \text{ mm} \quad Y-Z = 0,4 \text{ mm}$$

#### Control

Formule:

$$\Delta K_w \text{min} \leq \frac{X}{K_x} + \frac{Y-Z}{K_y} \leq 0,75 \times \Delta K_w \text{max}$$

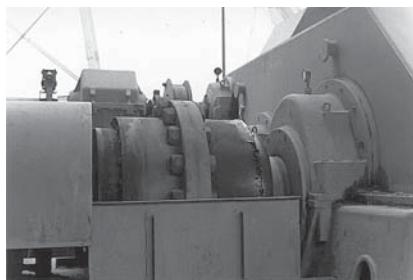

$$\text{Calculation: } 0,1^\circ \leq \frac{0,9}{5,7} + \frac{0,4}{8,2} \leq 0,75 \times 0,4 \quad \text{ok}$$

LEGEND OF USED PICTOGRAMS		Notes for series F
	MAXIMUM NOMINAL BORE (mm)	1 For key according to ISO R 773.
	MINIMUM BORE (mm)	2 Gear maximum continuous transmissible torque for the tabulated misalignment. The effective transmissible torque depends on the bore and shaft/hub connection.
	MAXIMUM BORE (mm)	3 Higher speed on special request.
	MAXIMUM NOMINAL TORQUE (Nm)	3.1 For grease withstandng centrifugal acceleration of 1.000g. See installation and maintenance manual IM.
	MAXIMUM PEAK TORQUE (Nm)	3.2 For grease withstandng centrifugal acceleration of 2.000g. See installation and maintenance manual IM.
	MAXIMUM SPEED (rpm)	3.3 Depends on S.
	MAXIMUM OFFSET (mm)	3.4 For long operation in disconnected position contact us.
	MAXIMUM ANGULAR MISALIGNMENT (degree)	4 For solid bore.
	INERTIA ( $\text{kgm}^2$ )	4.1 Depends on S.
	WEIGHT (kg)	4.2 For solid bore and S minimum.
	GREASE QUANTITY ( $\text{dm}^3$ )	4.3 Per 100 mm spacer length.
		4.4 Depends on L and R.
		5 For pilot bored hubs.
		5.1 Depends on S.
		5.2 For pilot bored hubs and S minimum.
		5.3 Per 100 mm spacer length.
		5.4 Depends on L and R.
		6 See installation and maintenance manual IM.
		6.1 Depends on S. Values given for S maximum.
		7 On request. For larger S contact us.
		8 Values for S minimum. S maximum depends on torque and speed.
		9 G must remain constant during operation.
		10 Needed to control the alignment and inspect the gears.
* Max. torque, speed and misalignment tabulated values may not be cumulated See IM/B400.

INSTALLATION & MAINTENANCE

## **1. INTRODUCTION --- English**

Coupling must be selected properly according to selection chart A 150 and corresponding charts. These documents are available in coupling catalogue ESCOGEAR FST or on our web site «www.escocoupling.com». Maximum misalignment figures at assembly are given in this document (see point 4: assembly). Max misalignment figures in operation are given in ESCOGEAR FST catalogue. Max misalignment, max speed and max torque may not be applied simultaneously as mentioned in selection chart A 150. In case of any change or adaptation not performed by ESCO on the coupling, it is customer responsibility to size and manufacture it properly to guarantee safe torque transmission and absence of unbalance that could affect the life of the coupling and the connected machines. It is customer responsibility to make sure that shaft and key material, size and tolerance suit the application. Maximum bore capacity is given in the catalogue. If key assembly is not calculated and machined by ESCO, it is customer responsibility to make sure that hub length, bore size and machining tolerances will transmit the torque. If interference fit is not calculated and machined by ESCO, it is customer responsibility to make sure that interference and machining tolerances will transmit the torque and not exceed hub material permissible stress. The hubs must be axially secured on the shaft by means of a setscrew, an end plate or a sufficient interference. In case of spacer or floating shaft not supplied by ESCO, it is customer responsibility to size and manufacture it properly to guarantee safe torque transmission and absence of unbalance that could affect the life of the gearing. It is customer responsibility to protect the coupling by p.ex. a coupling guard and to comply with the local safety rules regarding the protection of rotating parts.

## **2. PREPARATION**

Ensure the conformity of the supplied equipment:

--- Verify coupling size and conformity (see catalogue or web site). --- Identify any damaged and/or missing parts.

--- Verify conformity of the coupling/machine interfaces.

Coupling original protection allows for storage indoors dry 18 months, indoors humid 12 months, outdoors covered: 9 months and outdoors open: 3 months. For longer periods, it is customer responsibility to protect the parts properly. Instructions are a part of the supply of the coupling. Be sure valid and complete assembly, operation and maintenance instructions are available. Make sure they are well understood. In case of doubt, refer to ESCO. Assembly, disassembly and maintenance must be performed by qualified, trained and competent fitters. Before starting with assembly, disassembly and maintenance, verify the availability of the tooling necessary

--- To manipulate the parts --- To assemble the interfaces --- To align the coupling --- To tighten the screws and nuts.

## **3. WARNINGS**

Before removing the coupling guard and proceeding with any assembly, operation or maintenance operation of the coupling, make sure the complete system is completely shut down and definitively disengaged from any possible source of rotation, such as, for example:

--- Electrical power supply. --- Any loss of braking effect.

Make sure everyone attending the equipment area will be properly informed (for example by means of warnings properly located) about the maintenance or assembly situation. In case of use in explosive atmospheres , specific protective measures must be considered. They are described in an extra attachment (IM/A200-Ex) to the actual instructions with the couplings marked .

## **4. ASSEMBLY**

### **4.1 Coupling without end-cap**

4.1.1 Ensure all parts are clean.

4.1.2 Apply a light coat of grease to the O-Rings A and insert O-Rings into grooves J of sleeves B.

4.1.3 Place sleeves B over shaft ends. Care should be taken not to damage O-Rings A.

4.1.4 Install hubs C on their respective shafts with the longest hub end towards shaft end or towards machine bearing depending on the type (see fig. 1 and 3). If needed, for keyway assembly, uniformly heat hubs C (max 120°C) to install them easily on the shaft, in this case, avoid any contact between the hub C and O-Ring A. Hub faces have to be flush with shaft end. In case of doubt, please consult us. Introduce setscrew on key with Loctite and tighten properly. In case of interference fit, refer to ESCO for proper instructions.

4.1.5 Install units to be connected in place and check the spacing G between hubs. See tabulation or approved drawing for correct hub spacing G, according to coupling size. In case of doubt, please consult us.

4.1.6 Align the two shafts, check alignment using an indicator. For alignment precision: see tabulation 4.

4.1.7 Coat hub and sleeve gearings with grease (see tabulation 3) and slide sleeves B over hubs.

4.1.8 Insert gasket F and bolt sleeves together. Tighten bolts uniformly. See tabulation 2 for correct tightening torque (T1 Nm). Make sure that sleeves are freely sliding over hubs by axially displacing it to a value equal to G (see tabulation 1).

4.1.9 For the types FST, FMM and FDMM, remove both lube plugs H of one sleeve B and add grease in sufficient amount to overflow with lubricant holes in horizontal position. For the types FFS, FSE, FSLE, FLE, FSP, FIN and FSV repeat this operation for the second sleeve. For quantity and quality of grease, see tabulation 3. Re-install the 2 plugs H; see tabulation 2 for correct tightening torque (T3 Nm) and key size (s mm). For type FSV consult us.

### **4.2 Coupling with end-cap**

4.2.1 Ensure all parts are clean.

4.2.2 Apply a light coat of grease to the O-Rings A and insert O-Rings into grooves J of end-cap X.

4.2.3 Place end-cap X and gasket XX over shaft ends. Care should be taken not to damage O-Rings A.

4.2.4 Install hubs C on their respective shafts with the longest hub end towards shaft end or towards machine bearing depending on the type (see fig. 2 and 3). If needed, for keyway assembly, uniformly heat hubs C (max 120°C) to install them easily on the shaft. In this case, avoid any contact between the hub C and O-Ring A. Hub faces have to be flush with shaft end. In case of doubt, please consult us. Introduce setscrew on key with Loctite and tighten properly. In case of interference fit, refer to ESCO for proper instructions

4.2.5 Install units to be connected in place and check the spacing G between hubs. See above tabulation or approved drawing for correct hub spacing G, according to coupling size. In case of doubt, please consult us.

4.2.6 Align the two shafts, check alignment using an indicator. For alignment precision: see tabulation 4.

4.2.7 Coat hub and sleeve gearings with grease (see tabulation 3) and slide sleeves B over hubs. Assemble end-caps K and gaskets L on sleeves B with screws M and locking rings. Tighten screws uniformly. See tabulation 2 for correct tightening torque (T2 Nm) and key size (s mm).

4.2.8 Insert gasket F and bolt sleeves together. Tighten bolts uniformly. See tabulation 2 for correct tightening torque (T1 Nm) and socket size. Make sure that sleeves are freely sliding above hubs by axially displacing it to a value equal to G.

4.2.9 For the types FST, FMM and FDMM, remove both lube plugs H of one sleeve B and add grease in sufficient amount to overflow with lubricant holes in horizontal position. For the types FFS, FSE, FSLE, FLE, FSP, FIN and FSV repeat this operation for the second sleeve. For quantity and quality of grease, see tabulation 3. Re-install the 2 plugs H; see tabulation 2 for correct tightening torque (T3 Nm) and key size (s mm). For type FSV consult us.

## **5. INSPECTION and MAINTENANCE**

### **5.1 Inspection**

Regular inspection (audio-visual) must occur for leakage, noise, vibration and loss of parts.

### **5.2 Maintenance**

#### **5.2.1 Every 4.000 hours or every year**

Check that sleeves are freely moving axially: follow instructions as indicated in Point 4.1.8 or 4.2.8.

Fill up grease level: Proceed as mentioned under 4.1.9. or 4.2.9

#### **5.2.2 Every 8.000 hours or every 2 years.**

-- Remove screws and nuts and gasket F. -- Clean and control gearing and sealing.

-- Control alignment See Point 4.1.6 or 4.2.6. -- Reassemble coupling as per Point 4. It is recommended to replace gasket F and screws and nuts at every reassembly.

## TABULATION 4 : ALIGNMENT PRECISION

Alignment is measured as shown on the figure (Y - Z) for angular and X for offset.

Combination of angular and offset misalignment must comply with the following formulation:

$$\Delta K_{W\min} \leq \frac{X}{K_X} + \frac{Y-Z}{K_Y} \leq 0,75 \times \Delta K_{W\max}$$

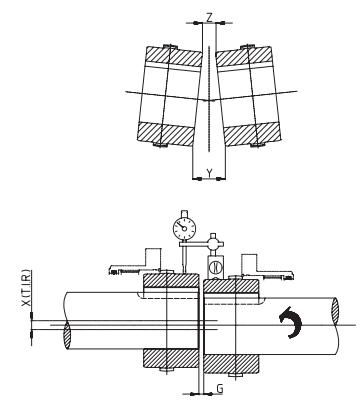

$\Delta K_W \text{ min} = 0,1^\circ$

 $\Delta K_W$  max depends on speed and torque as shown on graph (T, n) in coupling catalogue on page A150 E (a).

$$K_X = K_{X0} + \frac{S}{30} \quad \text{with } S = \text{Spacer lenght (mm)}$$

(If no spacer:  $S = 0$ )

$$K_Y = K_{Y0}$$

## Attachment : Specific Protective Measures Taken for ESCOGEAR Couplings in case of use in explosive atmospheres.

### 0 Introduction - English

General assembly and maintenance instructions (called IM in this attachment), are established for standard ESCOGEAR couplings according to the following list:

IM/A200 for ESCOGEAR NST couplings - IM/A300 for ESCOGEAR CST couplings

IM/B300 for ESCOGEAR CST-M couplings - IM/B400 for ESCOGEAR FST couplings

In case of use in potentially explosive atmospheres , further to the general assembly and maintenance instructions (IM/...), the specific measures described in this attachment must be taken.

### 1. Coupling Selection

The coupling must be selected according to the general assembly and maintenance instructions IM/... .

In explosive atmosphere , the following specific rules must apply:

- A Service Factor of 2 must be applied on the max torque values given in the charts in catalogue (see Selection chart A 150).
- A Service Factor of 2 must be applied on the reference torque values given on the selection chart A150 for the calculation of max misalignment in operation.
- Max misalignment (combination of angular and offset) may not exceed 0.5° per gear mesh.

### 2. Use of the coupling

The coupling is dedicated for use in potentially explosive atmospheres according to European Directive 94/9/EC (Atex 100A). Coupling is classified in equipment group II, equipment category 2 and 3, intended for use in areas in which explosive atmospheres caused by gases, vapours, mists of air/dust mixtures are likely to occur. In function of the ambient temperature in the coupling proximity (65, 55, 40°C), the temperature classes have been defined (T4, T5, T6). This is based on a temperature increase of the machine shafts (in regard of the ambient temperature) that will not exceed 40°C in operation.

The coupling is marked as follows: CE  II 2 G T4/T5/T6 D 105°C -20°C ≤ Ta ≤ 65°C / 55°C / 40°C

This marking covers the T3 temperature category.

This marking covers all gas categories: G IIA, G IIB and G IIC

### 3. Warnings

The warnings mentioned in the general assembly and maintenance instructions IM/... must apply in any case.

In explosive atmosphere , the following specific warnings must apply:

- Complete machining of the coupling parts (bores, keyways, spacers, floating shafts etc...) must be performed by ESCO Couplings N.V. No modification shall be made on the supplied and marked product without the agreement of ESCO Couplings N.V.
- In case of supply by ESCO Couplings of couplings with a rough bore or a solid bore, the sole allowed operation that may be performed by the customer is the boring and keywaying of the coupling hubs. When machining the bore and the keyway, the following instructions must be followed:
  - This job must be performed by an authorised and adequately trained and informed operator.
  - The bore and keyway tolerances must be selected to insure the proper fit between shaft and bore. In case of loose fit, a set screw must be foreseen to locate the hub axially.
  - The max bore may not exceed the value stated in the catalogue. The tabulated values in the catalogue are based on key dimensions according to ISO R 773.
  - The reference used to centre the piece when boring, is the one referenced D in the figures of the catalogue.
- Before proceeding with any assembly, operation or maintenance operation on the coupling, make sure that the necessary measures have been taken to ensure safety, such as but not limited to:
  - Proper ventilation of the area      ◦ Proper lightening and electrical tools.
  - If hub must be heated for assembly on the shaft, make sure heating source and surface temperature will not affect the safety of the working area.
  - It is recommended to have a strong coupling guard, preferably in stainless steel with openings (if any) smaller than the smallest centrifugable part (plug is 6 mm dia). The coupling guard is intended to protect the environment from the centrifugation of any rotating part and the rotating coupling from any falling part. To limit ventilation effects, distance between cover and coupling outside surface should be at least 10 mm.

### 4. Assembly

The general assembly and maintenance instructions IM/... must apply in any case.

In explosive atmosphere , the following specific instructions must apply:

- Alignment of the machine in cold condition must take into account the possible heat expansion to make sure that in continuous running conditions, max misalignment calculated in point 1 will not be exceeded.
- Max misalignment may never exceed 0.5° per gear mesh.
- To improve the coefficient of friction and the leakage resistance, use following lubricants dedicated for gear couplings:
  - TEXACO Coupling Grease      ◦ CALTEX Coupling Grease      ◦ KLÜBER Klüberplex GE 11-680      ◦ SHELL Albida GC1

### 5. Operation

The general assembly and maintenance instructions IM/... must apply in any case.

In explosive atmosphere , the following specific instructions must apply:

- Before Start-up
  - Make sure coupling is perfectly aligned and clean.      ◦ Make sure, screws, nuts and plugs are properly tightened.
  - Coupling guard must be properly installed and fixed.      ◦ Monitoring system, if any, must be tested to verify its effectiveness.
- During start up
  - Check for any leakage. In case of abnormal leakage, immediate stop is recommended.
  - Check for any abnormal noise and/or vibration. If any, immediate stop is recommended.
- Checking intervals during operation
  - After the first 2000 hours or 6 months: check
    - for leakage, noise, vibration and loss of parts.      ▪ for free axial movement of the sleeves in regard of the hubs.
  - After 4000 hours or one year
    - for leakage, noise, vibration and loss of parts.      ▪ for free axial movement of the sleeves in regard of the hubs.
- Continuous checking
  - Immediately stop the machine if noise, vibrations or other abnormal phenomena are detected during operation.
  - Further more, if direct check is not possible for access or safety reasons, proper monitoring system has to be installed to follow up couplings behaviour

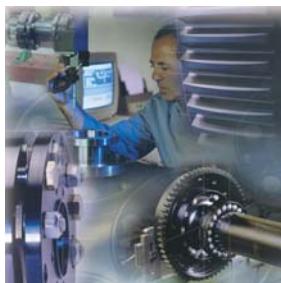

### 6. Maintenance

The general assembly and maintenance instructions IM/... must apply in any case.

In explosive atmosphere , the following specific instructions must apply:

- Every 6.000 hours or 1.5 year:
  - Dismount the coupling and inspect.      ◦ Proceed as indicated in point 4.

# Other coupling types available

Escodisc DLC / DMU / DPU

Escogear CST / CST...M

Escogear FST

Escoflex A-R-S-T  
Esconyl A-B-C

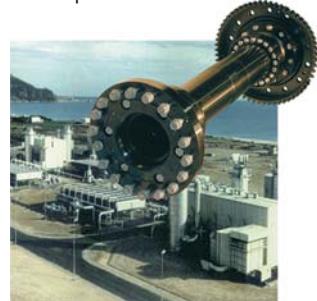

Escogear NST

Escorail FTRN /FTRNO

Escospeed DHSU - GHS
